Professor K-Mag Says:

Did You Know...

Less than one fifth of forage cropland is soil sampled.

Thus, the need for — and the application of — limestone often are postponed. K-Mag serves as an excellent, high analysis provider of K, Mg and S for these crops.

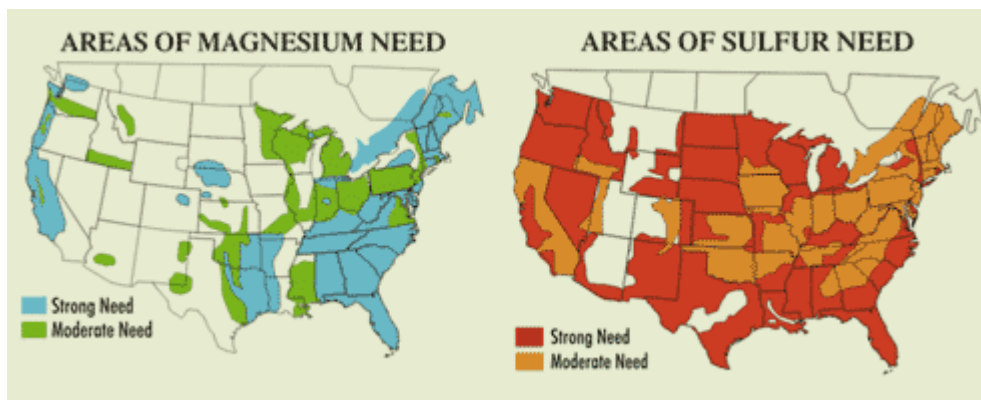

Shortages of Mg and S can be found nationwide. (See maps below)

K-Mag is well suited as a site-specific provider of Mg when soil test levels are in the responsive range.

K-Mag is a 3-in-1 storage solution.

K-Mag storage capacity expands the dealer storage for K by nearly a third. And, K-Mag can meet crop needs for both S and Mg.

The SGN numbers for K-Mag fit with those of the primary source of N, P and K. In contrast, dolomitic lime must be finely ground, applied separately and incorporated for best release of Mg to the crop.
